

Waste reduction and Recycling

initiative

Waste Audits

Conducting waste audits can help companies understand their current waste generation and disposal practices. By analyzing the types and quantities of waste produced, companies can identify areas for improvement and set specific waste reduction goals.

2

Source Reduction

In order to reduce waste, companies need to concentrate on prevention. This means that the products and packages should be redesigned, reusable materials promoted and excess supplies cut down through working together with suppliers.

Recycling Programs

Companies can implement efficient recycling programs by providing accessible bins for various materials and educating staff on proper waste separation.

4

Waste Management Infrastructure

Companies can invest in waste management infrastructure, such as partnering with waste management companies or building on-site recycling facilities.

Supplier Engagement

Companies can collaborate with suppliers to promote sustainable packaging and reduce waste through eco-friendly material use and increased recycling efforts.

6

Employee Engagement

Employee engagement is key to successful waste reduction. Companies should educate staff, encourage participation, and offer incentives to promote sustainable behaviors.

Collaboration and Partnerships

Companies can partner with communities, nonprofits, and governments to enhance waste reduction. This includes community clean-ups, supporting recycling infrastructure, and advocating for circular economy policies.

8

Monitoring and Reporting

Regular monitoring and reporting of waste data helps companies track progress, identify improvement areas, and demonstrate environmental commitment through target setting and showcasing waste diversion achievements.
